FIELD OBSERVATIONS

Fall report: August-November 2003.—This report consists of significant bird observations compiled by the Field Observations Committee (FOC). Submissions to the FOC should be in the following format: species, number of individuals, age and sex of the bird(s), color morph if applicable, location (including county), date, observer(s), and significance. Seasons are winter (December-February), spring (March-May), summer (June-July), and fall (August-November). Submit observations to regional compilers within two weeks after the close of each season, or to the state compiler within one month. Addresses of the compilers are found at the end of this report. We greatly prefer observations sent via e-mail.

Sight-only observations are considered “reports” while only those supported by verifiable evidence (photographs, videotapes, or specimens) are called “records.” Species for which documentation is required by the FOS Records Committee (FOSRC; Bowman 2000, *Fla. Field Nat.* 28:149-160) are marked here with an asterisk (*). We do not publish FOSRC review species submitted to us without documentation. A county designation (*in italics*) accompanies the first-time listing of each site in this report. Abbreviations used are: EOS = end of season, NP = national park, NS = national seashore, NWR = national wildlife refuge, RA = restoration area, SF = state forest, SP = state park, STF = sewage treatment facility, and N, S, E, W etc., for compass directions. Bold-faced species denote birds newly reported or verified in Florida, or record counts.

SUMMARY OF THE FALL SEASON

A major storm 28 September created spectacular fallouts of migrant landbirds along the central Gulf coast and elsewhere over the next several days. The largest fallout (“super huge”) occurred at Fort De Soto Park 29-30 September, with thousands of landbirds, including 24 warbler species each day (L. Atherton et al.). Also on the 29th, 15 warbler species were seen at Port Richey (K. Tracey). The fallout even extended inland; 15 warbler species were found in 3 hrs at Highlands Hammock SP 30 September (B. Pranty et al.). But not all the news from the fallout was positive—Marianne Korosy reported the following birds killed from flying into a 5-story building at Clearwater 30 September: 2 Red-eyed Vireos, 2 Swainson’s Thrushes, 2 Magnolia Warblers, one Blackburnian Warbler, one Palm Warbler, and single Summer and Scarlet tanagers.

Twelve FOSRC rarities were reported this fall: 3 Ross’s Geese and one Sage Thrasher at Fort Walton Beach, the White-cheeked Pintail at Homestead, 3 Elegant-type Terns at Fort De Soto Park, the Long-billed Murrelet from *Broward*, Say’s Phoebe, American Tree Sparrow, and Brewer’s Sparrow (the first Florida report) at Fort Pickens, Tropical and Cassin’s kingbirds at Lake Apopka, MacGillivray’s Warbler at Davie, and Black-faced Grassquit at Everglades National Park. New exotics were the two Gray Partridges at Lake Apopka and the White-necked Raven near Delray Beach.
