

Figure S3. Mean Effect Size Ratio for Within Paper Analyses: None of the analyses have means that differed from zero, indicating no difference between biomass for allopatric pairings compared to sympatric. Values shown represent the ratio of weighted mean effect sizes (ES) \pm standard error for arbuscular mycorrhiza from within paper examinations of the plant and fungi, fungi and soil, and plant and soil. The dotted line indicates no response, values above the line indicate positive local adaptation, and values below the line indicate maladaptation.
